

# IntelligenceOps Synthetic Executive Decision Memo

## Demo Data | Flight Operations Intelligence

Scope: Demo Data

Selection: Monthly | 2025-12 | NETWORK

Generated: 2026-05-07 12:06:11

This public memo uses demo data to demonstrate method, governance, TAT timing-risk framing, and decision routing. It does not contain employer data, real station figures, internal context, or company identity.

## Executive Summary

| Signal                | Value                                                                                               | Decision use                 |
|-----------------------|-----------------------------------------------------------------------------------------------------|------------------------------|
| OTP D15               | 80.1%                                                                                               | selected scope               |
| Target                | 85.0%                                                                                               | demo target benchmark        |
| Target gap            | -4.9 pts                                                                                            | positive means above target  |
| Flights operated      | 1,130                                                                                               | materiality context          |
| Top pain station      | NXC demo station by Ground Ops minutes                                                              | where review starts          |
| Primary action review | Review the highest-impact demo station using selected-scope Ground Ops and delay-category evidence. | public-safe next review path |

## Decision Impact

|                           |                                                                                                                                                            |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Top controllable bucket   | Ground Ops controllable delay   Start where controllable exposure is largest.                                                                              |
| Top station               | NXC demo station   1,158 Ground Ops minutes   Use station evidence before escalating network action.                                                       |
| Minutes exposed           | 3,864   Magnitude of selected-scope controllable exposure.                                                                                                 |
| 15% minutes-only scenario | A 15% reduction in the top Ground Ops driver would remove 174 minutes from the selected scope.   No OTP lift is claimed without scenario-model validation. |

## Leadership Framing

- Decision context: convert operational evidence into a review sequence.
- OTP vs target and gap: -4.9 points vs 85.0% target.
- Headline operational pain: NXC demo station has the highest average delay in the selected scope; Inherited / reactionary is the largest delay context bucket at 8,571 minutes.
- Action focus: Review the highest-impact demo station using selected-scope Ground Ops and delay-category evidence.
- Data note: figures are from the public demo dataset.

## Action Lanes

| Ground Ops controllable delay |                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------|
| Reason                        | boarding closure, ramp coordination, baggage delivery, load control readiness                        |
| Action route                  | Station Manager / GHA with Area Manager follow-up                                                    |
| Evidence                      | NXC demo station 1,158 min; NXF demo station 1,032 min                                               |
| Decision                      | Start with local turnaround readiness review using Ground Ops code 89, not network-level escalation. |

| Reactionary / inherited delay protection |                                                                                                            |
|------------------------------------------|------------------------------------------------------------------------------------------------------------|
| Reason                                   | aircraft rotation protection and knock-on delay containment                                                |
| Action route                             | OCC / Network Control with cross-functional governance review                                              |
| Evidence                                 | Inherited / reactionary 8,571 min; largest bucket Inherited / reactionary; start with reactionary code 93. |
| Decision                                 | Governance review before assigning Ground Ops action.                                                      |

| Station follow-up / local drilldown |                                                                                                   |
|-------------------------------------|---------------------------------------------------------------------------------------------------|
| Reason                              | local review required before assigning accountability                                             |
| Action route                        | Cross-functional governance review                                                                |
| Evidence                            | NXC demo station   flights 233   avg delay 24.03 min   sufficient demo volume for review.         |
| Decision                            | Use local drilldown on the highest-priority demo station; avoid over-reading low-volume averages. |

## Ground Ops Impact Stations

| Station          | Flights | OTP D15 | GOPS min | GOPS share (%) | Action / caveat                                                                                                     |
|------------------|---------|---------|----------|----------------|---------------------------------------------------------------------------------------------------------------------|
| NXC demo station | 233     | 68.6%   | 1,158    | 20.7%          | Review turnaround readiness pattern: boarding closure, ramp coordination, baggage delivery, load control readiness. |
| NXF demo station | 376     | 85.8%   | 1,032    | 23.0%          | Monitor local process consistency; delay exposure exists despite acceptable OTP.                                    |
| NXA demo station | 131     | 75.0%   | 598      | 22.5%          | Review turnaround readiness pattern: boarding closure, ramp coordination, baggage delivery, load control readiness. |
| NXB demo station | 129     | 76.4%   | 491      | 23.2%          | Review turnaround readiness pattern: boarding closure, ramp coordination, baggage delivery, load control readiness. |
| NXE demo station | 118     | 84.8%   | 309      | 25.6%          | Review turnaround readiness pattern: boarding closure, ramp coordination, baggage delivery, load control readiness. |

## Delay Context Indicators

| Indicator                             | Minutes | Share | Basis                                  |
|---------------------------------------|---------|-------|----------------------------------------|
| Controllable Ground Ops minutes       | 3,864   | 22.0% | selected-scope evidence from demo data |
| Controllable Other categories minutes | 2,440   | 13.9% | selected-scope evidence from demo data |
| Inherited / reactionary minutes       | 8,571   | 48.9% | selected-scope evidence from demo data |
| Other / not classified minutes        | 2,670   | 15.2% | selected-scope evidence from demo data |

## Network KPI Summary

| Metric                                        | Value                        | Note                              |
|-----------------------------------------------|------------------------------|-----------------------------------|
| Flights operated                              | 1,130                        | selected scope                    |
| Avg DEP Delay per Flight                      | 15.53                        | computed (total/flights)          |
| DEP OTP D15                                   | 80.1%                        | target benchmark 85.0%            |
| Top station by Avg DEP Delay per Flight       | NXC demo station   24.03 min | sufficient demo volume for review |
| Benchmark station by Avg DEP Delay per Flight | NXD demo station   10.19 min | sufficient demo volume for review |

## Station Ranking Snapshot

| View                           | Station          | Avg delay | Flights | Materiality note                  |
|--------------------------------|------------------|-----------|---------|-----------------------------------|
| Top station by Avg Delay       | NXC demo station | 24.03     | 233     | sufficient demo volume for review |
| Benchmark station by Avg Delay | NXD demo station | 10.19     | 143     | sufficient demo volume for review |

## Confidence / Caveats

- Evidence basis: selected-scope evidence from demo data.
- This public executive memo uses demo data. It demonstrates method, governance, TAT timing-risk framing, and decision routing. It does not contain employer data, real station figures, internal context, or company identity.
- Delay Category / Owner basis: DelayCategory.
- TAT layer caveat: TAT is represented as a decision-support lens in this public demo, using synthetic framing rather than private operational timing evidence.
- Technical appendix is available only when enabled.
